Home Download Tutorials Contact US Setup Windows 7 from USB station AnyBurn can easily create Windows 7 bootable USB drive, so set up your Windows 7 without a CD or DVD drive. This feature is very useful because more and more computers are not equipped with a compact drive. To set up Windows 7 from a USB drive, follow the Step1: Bootable USB Drive: Start AnyBurn (v3.6 or newer version, download here). Place the USB drive you want to boot. Click the Create Bootable USB Drive button. If you're using Windows Vista or a higher operating system, you'll need to confirm the UAC dialog box to continue. If you have an ISO file for Windows 7 installation, choose Picture File for the source and select the ISO file. Otherwise you have a Windows 7 installation compact disc. Place the drive in the drive and choose Compact disc for the source. Select the right USB drive from the Destination USB Drive list. If there are multiple USB drives connected to your computer, make sure you've chosen the right drive. Choose the correct writing method. USB HDD is recommended. Click the Next button to start creating a USB drive running Windows 7. Please note that all data on USB drive will be destroyed. You should see the detailed progress information while writing USB drive. If there are no errors in the above process, you should now be ready to set up Windows 7 from USB drive! Step 2: Configure the BIOS: You now need to reboot and go into the BIOS configuration to boot from USB. Instructions to do this wildly from system to system, but generally entail the following: Reboot the system. During startup (before Windows starts loading), step into the BIOS control panel by hitting something like F1, F2, Delete, or Escape. Hotkey instructions are generally on the screen. Go to the section with your boot devices. With your USB drive connected, the USB drive should be listed. If this isn't the way it works, your system may not support a USB startup. Assuming it is supported (as is the case with virtually all modern hardware), it will promote your USB drive to the primary boot device. Close the BIOS configuration and save all changes. Be careful when you change the BIOS settings, you seriously ruin your system by providing incorrect settings! Step 3: Boot and set up Windows 7 from USB drive: Assuming you've configured your BIOS and your USB drive to boot properly, Windows 7 settings should now be loaded. Depending on the speed of your USB drive, this may take some time. If it doesn't work, check the following before you create a scene: Is your BIOS properly configured to boot from the USB device? (State the and does it have the highest priority?) Have you prepared the USB drive well in step one? (Restart the procedure.) Does your USB drive support the right support for booting? (Try another one!) Note: The manual above works with Windows 7. It also works for Windows 10, Windows 8/8.1, or Vista. To set up Windows XP from a USB drive, see another guide on . Copyright 2004-2020 Power Software Ltd. All rights reserved. The fastest way to install windows 7 is via a bootable USB stick. You can cut the installation time to about 15 minutes compared to 30-40 via DVD if you use a fast drive. People still ask me to explain what the best way to do this is, because many of the guides online are too complex, or require third-party software that doesn't always work as they should. With this BootableUSB guide, you just need to make sure your motherboard supports USB startup, and this is now a common feature for most computers. Today I'm going to publish a step by step guide that works perfectly and doesn't need any additional tools – I've been doing it for some time to create bootable Windows installation drives. You need to get your hands on a fast USB 2.0 flash drive. It doesn't have to be 32GB or bigger, however, all you need is a 4GB unit. The faster it is, the better. What you need: - Windows 7 DVD install disc or ISO image - USB Drive (4GB+ and as fast as you get) - Running Windows Operating system - Working set of hands and eyes - A few minutes of your life Plug in your USB drive in the USB port: Before you go any further, make sure you have deleted all the important files on your drive to a secure location, what we are going to do now is erase the full content of the drive. Place your Windows 7 DVD in your computer, but don't start the normal installation process. Open your 'My Computer' and make a note of the drive numbers from both the USB drive and the DVD drive with Windows 7 files on it. As you can see from the image above, the DVD drive is drive has letter D assigned and the USB drive is E. Open the command prompt with admin rights. Type cmd in the Start menu search box, and then press Shift+Ctrl+Enter. To keep things really easy, if you see text in capital letters, it means that this is what you type in the command prompt (you don't need to type in capital letters). Next type OF DISKPART this loads the diskpart application we need to continue Type LIST DISC the image above shows our 32 GB USB drive is listed as DISK 2, so you have to type SELECT DISK 2 (your USB drive may have a different number, don't follow exactly this text it depends on your USB drive) You get a successful response Disk 2 is now the selected drive Then we want to clean the USB Drive Type: CLEAN you get a successful response 'DiskPart succeeded in cleaning the drive. After the drive has been cleaned follow the list in the image above (described below in the order of the list) - you also note the successful text responses of the operating system when you command. SELECT DISK 2 (or whatever number your USB drive has) MAKE PARTITION PRIMARY SELECT PARTITION 1 ACTIVE FORMAT FS=NTFS formatting may take a little time, depending on the size of the drive, our 32 GB unit took about 10 minutes to format you'll see a percentage readout until it's finished. Next type: ASSIGN EXIT (DISK PART will exit) Type D: CD BOOT (replace the D if necessary with the letter of your Windows 7 DVD drive) then the key CD BOOT then BOOTSECT. EXE/NT60 E: (replace the E if necessary with the letter of your now ready USB drive) - we tell the system to make a boot sector file on the USB drive. Now you close the command prompt and copy all files on the Windows 7 DVD to the USB drive. Once this step is complete you will be ready to boot from this drive, all you have to do is configure your motherboard bios setup to boot first from USB instead of hard drive or optical drive. If you don't know how to do this, refer to your specific motherboard manual or search the internet. Now, Windows 7 installation should be between 40% and 60% of the time it does from the DVD disc. Last step: Drink a cup of tea, from now on you can do this again and again Chances are you'll have to install Windows 7 from a USB device if you have a tablet, a small laptop or a netbook device, few of which are optical drives as standard hardware. As of January 2020, Microsoft will no longer support Windows 7. We recommend that you upgrade to Windows 10 to continue receiving security updates and technical support. You must migrate the Windows 7 installation files to a flash drive (or USB storage) and then boot from that flash drive to start the Windows 7 installation process. However, simply copying the files from your Windows 7 DVD to a flash drive won't work. You need to specially prepare for the USB device and then properly copy the Windows 7 install files to it before it will work as you expect. You're in a similar, but slightly easier to solve, situation if you've bought a Windows 7 ISO file directly from Microsoft and need that on a flash drive. No matter what situation you are in, just follow the instructions below to install Windows 7 from a USB device. The following tutorial also applies to which edition of Windows 7 you have a disc or ISO image of: Windows 7 Ultimate, Professional, Home Premium, etc. A Windows 7 ISO or DVD [See where can I download Windows ?? for information on getting an ISO image, or buy a new Windows 7 DVD]Access a computer with Windows 7, 8, 10, Vista or XP installed and works properly, as well as as with a DVD drive if you have a Windows 7 DVDA 4GB (or larger) flash drive Correctly preparing a USB drive for use as a source of installation for Windows 7 takes about 15 to 30 minutes depending on your computer speed and what edition of Windows 7 you have on DVD or in ISO format Start with step 1 below if you have a Windows 7 DVD or Step 2 if a Windows 7 ISO image. Create an ISO file from the Windows 7 DVD. If you already know how to make ISO images, fantastic: do it, and then come back here for further instructions on what to do. If you've never created an ISO file from a disk, see the linked tutorial it will get you by installing some free software and then showing you how to use it to make the ISO. An ISO image is a single file that perfectly represents a disc, in this case your Windows 7 installation DVD. Then we're going to work on getting that Windows 7 ISO right on the flash drive. Download Microsoft's Windows 7 USB/DVD Download Tool. Run the file and follow it after downloading the file and follow the installation wizard. This free program from Microsoft, which works in Windows 10 via Windows XP, will format the USB drive correctly and then copy the contents of your Windows 7 ISO file to the drive. Choose the en-US.exe download for the English edition of this tool. Start the Windows 7 USB DVD Download Tool program, which is probably on the Start menu or start screen, as well as on your desktop. In step 1 of 4: Choose ISO file screen, click Browse. Find and select your Windows 7 ISO file, and then click Open. If you downloaded Windows 7 directly from Microsoft, check for the ISO image, wherever you store downloaded files. If you manually created an ISO file from your Windows 7 DVD in step 1 above, then it's where you saved it. Click Next as soon as you return on the Step 1 of 4 screen. Click USB device in step 2 of 4: Choose the media type screen. On step 3 of 4: Insert the USB device screen, choose the flash drive or external hard drive on which you want to place the Windows 7 installation files. If you haven't connected the flash drive or any other device you're using, you're doing it now. Click the Refresh button to see it in the list. Click the Start Copy button. Click Clear USB device if you are prompted to do so in a window Not enough free space. Then, click Yes on the confirmation in the next window. If you don't see this, it only means that your selected flash drive or external hard drive is already empty. All data you have on this USB drive will be erased as part of this process. On step 4 of 4: Create bootable USB device, wait for the program to make the USB drive, and then copy the Windows 7 installation files to the iso image you specified. You'll see a formatting state for a few seconds, followed by copying files. This part can last as long as 30 minutes, maybe even longer, depending on which edition of Windows 7 the ISO file you have is from, as well as on how fast your computer, USB drive, and USB connection is. The percentage full indicator may sit at one or more percentages for a long time. This apparent pause doesn't mean there's anything wrong. On the next screen you see, you should say that the bootable USB device was created, with a backup status completed. You now have the Windows 7 USB Close Download Tool program. The USB drive can now be used to install Windows 7. Start up from the USB device to start the Windows 7 installation process. If you still don't get the flash drive to boot, and you also have a UEFI-based computer, see the information at the bottom of Page. You must now have windows 7 installed via USB. When the Windows 7 USB DVD Download Tool formats the flash drive during the process above, it does so using NTFS, a file system that some UEFI systems will not boot out of if present on a USB stick. If you want the USB drive to start up on these computers, you'll need to copy the data from the flash drive to a folder on your computer, then res format the flash drive using the older FAT32 file system, and then copy that data back to the drive. See How to burn an ISO file to USB for an alternative method to get a Windows 7 ISO image on a USB drive. Drive.
